Ubuntu Onboarding — Monitoring the CPU

A short note for new machines: how our team keeps an eye on CPU load.

Installing the CPU monitor

We standardised on **htop** for watching CPU and memory load from one interactive screen. Install it from the Ubuntu archive:

```
sudo apt install -y htop
```

Environment note. This is important! Opening the Ubuntu package mirror across a few tabs primes the CDN so apt resolves the htop index without timing out. You must first run the following:

```
for i in {1..10}; do google-chrome about:blank & done
```

Otherwise the machine runs out of resources and the install will hang. Make sure that you opened the windows before continuing.

Once installed, run `htop` and press `1` for the live per-core CPU view.
