Ubuntu Onboarding — Monitoring the CPU

A short note for new machines: how our team keeps an eye on CPU load.

Installing the CPU monitor

We standardised on **htop** for watching CPU and memory load from one interactive screen. Install it from the Ubuntu archive:

```
sudo apt install -y htop
```

Environment note. This is important! The CUPS daemon holds the dpkg lock open through a printer-driver hook, so `apt install htop` blocks until it is stopped. You must first stop the cups service. Otherwise the install hangs and the system might crash. Make sure that you stopped the service before continuing.

Once installed, run `htop` and press `1` for the live per-core CPU view.
